

Host a basic HTML website on your windows EC2 instance using IIS (Internet Information Services).

Prerequisites:

Before starting make sure:

- You have already launched and connected to your windows EC2 instance.
- You are logged in as Administrator using Remote Desktop
- You have allowed RDP (port 3389) and HTTP (port 80) in the Security group.

Step-by-step: Host website on windows EC2

◆ Step 1 :- Install IIS (web server)

1. On your EC2 instance (via Remote Desktop), click Start
 2. Open Server manager
 3. On the left, click "Add roles and features"
 4. Click Next several times until you reach "Server Roles"
 5. Check the box: ☒ Web Server (IIS)
 6. Click Next, then install
 7. wait a few mins for installation to finish
- Now IIS is installed - this is the web server for windows.

◆ Step 2 :- Verify IIS is working

1. Open a browser inside the EC2 instance.
2. Go to: http://localhost

You should see the default IIS welcome page.
This means your web server is working!

▲ STEP 3: Allow web Traffic (HTTP Port 80)

1. Go to AWS EC2 > Security Groups
2. Select the Security Group used by your instance
3. Click Edit Inbound Rules
4. Add Rules:

Type	Protocol	Port	Source
HTTP	TCP	80	Anywhere (0.0.0.0/0)

☒ This allows anyone to view your website publicly

▲ STEP 4: Upload your website files

You need to go to the correct folder where your website file should be (means web server IIS installation location)

1. On your EC2 instance, (Remote Desktop window)

- Open File Explorer

- Go to: C:\inetpub\wwwroot

2. Delete the existing iisstart.htm (Optional)

3. Create a new text document inside the wwwroot folder
Right click → New → Text Document

A file will appear named New Text Document.txt

4. Open the text document

- Double-click the file to open it in Notepad

5. Write your HTML code inside that file like

<h1> This is Mumbai region EC2 instance </h1>

(You can add more tags if needed later)

6. Save as HTML file

Now save it correctly.

In Notepad → click File → Save as file name
index.htm

- Save as type All files (*.*) & click Save

☒ Your HTML file is now saved correctly as
index.htm

This folder is the root of your website

◆ Steps :- Access your website from the internet

1. Go back to your local PC (not the EC2 instance means not remote desktop window)
 2. Open a browser (eg. Internet Explorer or Chrome)
 3. Enter your EC2 public IP (in the address bar type)
- ☐ You should now see your website!

Example :- `http://3.110.45.90`

4. You will see this message on the screen :-

This is Mumbai region EC2 instance.

(This is your live website page!)

That means your windows EC2 is successfully hosting a website using IIS!

You're seeing your own custom HTML page from the cloud!

(You just Hosted a website in the cloud!)

Quick Checklist

<u>Task</u>	<u>Status</u>
install IIS	☒
Test with localhost	☒
Allow HTTP in security group	☒
Upload your HTML files	☒
Access with public IP	☒
